ARYL / HETARYL SUBSTITUTED IMIDAZOQUINOLINES

FIELD OF THE INVENTION

5 This invention relates to derivatives of imidazoquinoline compounds and to pharmaceutical compositions containing the compounds. A further aspect of this invention relates to the use of these compounds as immunomodulators, for inducing cytokine biosynthesis in animals and in the treatment of diseases including viral and neoplastic diseases.

10

BACKGROUND OF THE INVENTION

 The first reliable report on the 1H-imidazo[4,5-c]quinoline ring system, Backman et al., *J. Org. Chem.*, 15, 1278-1284 (1950) describes the synthesis of 1-(6-methoxy-8-quinolinyl)-2-methyl-1H-imidazo[4,5-c]quinoline for possible
15 use as an antimalarial agent. Subsequently, syntheses of various substituted 1H-imidazo[4,5-c] quinolines were reported. For example, Jain et al., *J. Med. Chem.*, 11, 87-92 (1968), synthesized the compound 1-[2-(4-piperidyl)ethyl]-1H-imidazo[4,5-c]quinoline as a possible anticonvulsant and cardiovascular agent. Also, Baranov et al., *Chem. Abs.*, 85, 94362 (1976), have reported several 2-
20 oxoimidazo[4,5-c]quinolines, and Berenyi et al., *J. Heterocyclic Chem.*, 18, 1537-1540 (1981), have reported certain 2-oxoimidazo[4,5-c]quinolines.

 Certain 1H-imidazo[4,5-c]quinolin-4-amines and 1- and 2-substituted derivatives thereof were later found to be useful as antiviral agents, bronchodilators and immunomodulators. These are described in, inter alia, U.S.

There continues to be interest in the imidazoquinoline ring system and there is a continuing need for compounds that have the ability to modulate the immune response, by induction of cytokine biosynthesis or other mechanisms.

SUMMARY

The present invention provides a new class of compounds that are useful in inducing cytokine biosynthesis in animals. Such compounds are of the following Formula (I):

I

and more specifically of the following Formula (II):

II

wherein: R , n , R' , R'' , R_1 , R_2 , and R_3 are as defined below.

The compounds of Formulas I and II are useful as immune response modifiers (IRMs) due to their ability to modulate cytokine biosynthesis (e.g., induce or inhibit the biosynthesis or production of one or more cytokines) and otherwise modulate the immune response when administered to animals.

Compounds can be tested per the test procedures described in the Examples

Section. Compounds can be tested for induction of cytokine biosynthesis by incubating human PBMC in a culture with the compound(s) at a concentration range of 30 to 0.014 μ M and analyzing for interferon (α) or tumor necrosis factor (α) in the culture supernatant. Compounds can be tested for inhibition of
5 cytokine biosynthesis by incubating mouse macrophage cell line Raw 264.7 in a culture with the compound(s) at a single concentration of, for example, 5 μ M and analyzing for tumor necrosis factor (α) in the culture supernatant. Compounds can be further tested for dose response by running the test at several compound concentrations, for example, 0.03, 0.1, 0.3, 1, 3, 5, and 10 μ M. The
10 ability to modulate cytokine biosynthesis makes the compounds useful in the treatment of a variety of conditions such as viral diseases, neoplastic diseases, and autoimmune diseases that are responsive to such changes in the immune response.

In another aspect, the present invention provides pharmaceutical
15 compositions containing the immune response modifier compounds, and methods of modulating (e.g., inducing or inhibiting) cytokine biosynthesis in an animal, treating a viral disease in an animal, and treating a neoplastic disease in an animal, by administering an effective amount of one or more compounds of Formula I (and more specifically, of Formula II) and/or pharmaceutically
20 acceptable salts thereof to the animal.

In another aspect, the invention provides methods of synthesizing compounds of Formulas I and II and intermediates useful in the synthesis of these compounds.

As used herein, "a," "an," "the," "at least one," and "one or more" are
25 used interchangeably.

The terms "comprising" and variations thereof do not have a limiting meaning where these terms appear in the description and claims.

The above summary of the present invention is not intended to describe each disclosed embodiment or every implementation of the present invention.
30 The description that follows more particularly exemplifies illustrative embodiments. Guidance is also provided herein through lists of examples, which can be used in various combinations. In each instance, the recited list

serves only as a representative group and should not be interpreted as an exclusive list.

Herein, "non-interfering" means that the ability of the compound or salt to modulate (e.g., induce or inhibit) the biosynthesis of one or more cytokines is not destroyed by the non-interfering substituent. Illustrative non-interfering R' groups include those described above for R₁ in Formula II. Illustrative non-interfering R" groups include those described above for R₂ in Formula II.

As used herein, the terms "alkyl," "alkenyl," "alkynyl" and the prefix "alk-" are inclusive of both straight chain and branched chain groups and of cyclic groups, i.e. cycloalkyl and cycloalkenyl. Unless otherwise specified, these groups contain from 1 to 20 carbon atoms, with alkenyl groups containing from 2 to 20 carbon atoms, and alkynyl groups containing from 2 to 20 carbon atoms. In some embodiments, these groups have a total of up to 10 carbon atoms, up to 8 carbon atoms, up to 6 carbon atoms, or up to 4 carbon atoms. Preparation of the Compounds

10 Compounds of the invention can be prepared using known palladium catalyzed coupling reactions such as Suzuki coupling, Stille coupling, Sonogashira coupling, and the Heck reaction.

Suzuki coupling is used in Reaction Scheme I where R_1 , R_2 , and R are as defined above, R_{3a} is $-Z_a-Ar$, $-Z_a-Ar'-Y-R_4$, or $-Z_a-Ar'-X-Y-R_4$ where Z_a is a bond, alkylene or alkenylene, and Hal is bromo, chloro or iodo.

15 In Reaction Scheme I a halogen substituted imidazoquinoline of Formula IX is coupled with a boronic acid of Formula X to provide an imidazoquinoline of Formula XI which is a subgenus of Formula II. A compound of Formula IX is combined with a boronic acid of Formula X in the presence of palladium (II) acetate, triphenylphosphine and a base such as sodium carbonate in a suitable
20 solvent such as n-propanol. The reaction can be carried out at an elevated temperature (e.g., 80-100°C).

Reaction Scheme I

25

Many compounds of Formula IX are known. See, for example, U.S. Patent Nos. 4,689,338; 4,929,624; 5,268,376; 5,346,905; 5,389,640; 5,756,747; 6,331,539; and 6,451,810; PCT Publications WO 00/76518; WO 02/46188, WO

02/ 46189; WO 02/46190; WO 02/46191; WO 02/46192; and WO 02/46193;
European Patent Application 1 104 764; and Japanese Patent Application 9-
255926. Others can be readily prepared using known synthetic methods. See,
for example, U.S. Patent Nos. 4,988,815; 5,175,296; 5,367,076; 5,395,937; and
5 5,741,908.

Many boronic acids of Formula X are commercially available; others can
be readily prepared using known synthetic methods. See, for example, Li, W. et
al, *J. Org. Chem.*, 67, 5394-5397 (2002). The Suzuki coupling reaction can also
be carried out using boronic acid esters of Formula $R_{3a}\text{-B(O-alkyl)}_2$ and
10 anhydrides of boronic acids of Formula X.

Compounds of the invention where Z is alkynylene can be prepared using
Stille coupling to couple a halogen substituted imidazoquinoline of Formula IX
with a terminal alkyne of the formula $\text{-C}\equiv\text{C-Ar}$.

Compounds of the invention can be prepared according to Reaction
15 Scheme II wherein R_b is selected from alkyl, and alkoxy; R_{1b} and R_{2b} are subsets
of R_1 and R_2 as defined above, which subsets do not include those substituents
which one skilled in the art would recognize as being susceptible to oxidation in
step (9), examples include substituents containing an -S- or a heteroaryl group;
 R_{3b} is aryl which may be unsubstituted or substituted by one or more substituents
20 independently selected from alkyl, alkoxy, haloalkyl, haloalkoxy, halogen, nitro,
cyano, carboxy, formyl, aryl, aryloxy, arylalkoxy, heterocyclyl,
heterocyclylalkyl, amino, alkylamino, and dialkylamino; and n is 0 or 1.

In step (1) of Reaction Scheme II a bromoaniline of Formula XII is
coupled with a boronic acid of formula $R_{3b}\text{-B(OH)}_2$, an anhydride thereof, or a
25 boronic acid ester of Formula $R_{3a}\text{-B(O-alkyl)}_2$ using the method described in
Reaction Scheme I to provide an aryl substituted aniline of Formula XIII. Many
bromoanilines of Formula XII are commercially available; others can be readily
prepared using known synthetic methods.

In step (2) of Reaction Scheme II an aryl substituted aniline of Formula
30 XIII is reacted with a mixture of triethyl orthoformate and Meldrum's Acid (2,2-
dimethyl-1,3-dioxane-4,6-dione) at an elevated temperature (50-55°C) to provide
a compound of Formula XIV.

In step (3) of Reaction Scheme II a quinolin-4-ol of Formula XV is prepared by thermolysis of a compound of Formula XIV. The reaction can be carried out by heating (approximately 215°C) a solution of the compound of Formula XIV in a heat transfer fluid.

5 In step (4) of Reaction Scheme II a quinolin-4-ol of Formula XV is nitrated using conventional nitration methods to provide a 3-nitroquinolin-4-ol of Formula XVI. The reaction can be carried out by combining the compound of Formula XV with nitric acid in a suitable solvent such as propionic acid at an elevated temperature (approximately 130°C).

10 In step (5) of Reaction Scheme II a 3-nitroquinolin-4-ol of Formula XVI is chlorinated using conventional chlorinating methods to provide a 4-chloro-3-nitroquinoline of Formula XVII. The reaction can be carried out by combining the compound of Formula XVI with phosphorous oxychloride in a suitable solvent such as toluene. The reaction can be carried out at ambient temperature.

15 In step (6) of Reaction Scheme II a 4-chloro-3-nitroquinoline of Formula XVII is reacted with an amine of Formula $R_{1b}-NH_2$ to provide a 3-nitroquinolin-4-amine of Formula XVIII. The reaction can be carried out by adding the amine to a solution of the compound of Formula XVII in a suitable solvent such as *N,N*-dimethylformamide (DMF) in the presence of a tertiary amine such as triethylamine. The addition can be carried out at a reduced temperature (0°C) or at ambient temperature.

20 In step (7) of Reaction Scheme II a 3-nitroquinolin-4-amine of Formula XVIII is reduced to provide a quinoline-3,4-diamine of Formula XIX. The reaction can be carried out using a conventional heterogeneous hydrogenation catalyst such as platinum on carbon or palladium on carbon. The reaction can conveniently be carried out on a Parr apparatus in a suitable solvent such as toluene, isopropanol, or mixtures thereof.

25 Alternatively the reduction in step (7) can be carried out using sodium dithionite. A solution or suspension of the compound of Formula XVIII in a suitable solvent such as ethanol or isopropanol is treated with an aqueous solution of sodium dithionite. The reaction can be carried out at an elevated temperature (reflux) or at ambient temperature.

30

In step (8) of Reaction Scheme II a quinoline-3,4-diamine of Formula XIX is reacted with a carboxylic acid or an equivalent thereof to provide a 1*H*-imidazo[4,5-*c*]quinoline of Formula XX. Suitable equivalents to carboxylic acid include orthoesters, and 1,1-dialkoxyalkyl alkanoates. The carboxylic acid or
5 equivalent is selected such that it will provide the desired R_{2b} substituent in a compound of Formula XX. For example, triethyl orthoformate will provide a compound where R_{2b} is hydrogen and trimethyl orthovalerate will provide a compound where R_{2b} is butyl. The reaction can be run in the absence of solvent or in an inert solvent such as toluene. The reaction is run with sufficient heating
10 to drive off any alcohol or water formed as a byproduct of the reaction. Optionally a catalyst such as pyridine hydrochloride can be included.

Alternatively, step (8) can be carried out by (i) reacting a compound of Formula XIX with an acyl halide of formula R_{2b}C(O)Cl or R_{2b}C(O)Br and then
15 (ii) cyclizing. In part (i) the acyl halide is added to a solution of a compound of Formula XIX in an inert solvent such as acetonitrile, pyridine or dichloromethane. The reaction can be carried out at ambient temperature. Optionally a catalyst such as pyridine hydrochloride can be included. In part (ii) the product of part (i) is heated in pyridine. If step (i) is run in pyridine, then the two steps can be combined into a single step.

20 In step (9) of Reaction Scheme II a 1*H*-imidazo[4,5-*c*]quinoline of Formula XX is oxidized to provide an N-oxide of Formula XXI using a conventional oxidizing agent that is capable of forming N-oxides. The reaction can be carried out by treating a solution of a compound of Formula XX in a suitable solvent such as chloroform or dichloromethane with 3-
25 chloroperoxybenzoic acid at ambient temperature.

In step (10) of Reaction Scheme II an N-oxide of Formula XXI is aminated to provide a 1*H*-imidazo[4,5-*c*]quinoline-4-amine of Formula XXII which is a subgenus of Formula II. The reaction is carried out in two parts. In
30 part (i) a compound of Formula XXI is reacted with an acylating agent. Suitable acylating agents include alkyl- or arylsulfonyl chlorides (e.g., benzenesulfonyl chloride, methanesulfonyl chloride, and *p*-toluenesulfonyl chloride). In part (ii) the product of part (i) is reacted with an excess of an aminating agent. Suitable

aminating agents include ammonia (e.g. in the form of ammonium hydroxide) and ammonium salts (e.g., ammonium carbonate, ammonium bicarbonate, ammonium phosphate). The reaction can be carried out by dissolving a compound of Formula XXI in a suitable solvent such as dichloromethane or chloroform, adding ammonium hydroxide to the solution, and then adding *p*-toluenesulfonyl chloride. The product or a pharmaceutically acceptable salt thereof can be isolated using conventional methods.

Reaction Scheme II

10

For some embodiments, compounds shown in Reaction Scheme II can be further elaborated using conventional synthetic methods. For example, an amine of Formula R_{1b}-NH₂, where R_{1b} is R_{4b} and R_{4b} is a subset of R₄ that does not include those substituents which one skilled in the art would recognize as being

15

susceptible to oxidation in step (9), may be substituted by a hydroxy or second amino group, which can be further functionalized before step (7) of Reaction Scheme II. For example, a 3-nitroquinolin-4-amine of Formula XVIII, in which R_{1b} is R_{4b} having an amino substituent, can react with an acid chloride of
 5 Formula $R_{4b}C(O)Cl$, a sulfonyl chloride of Formula $R_{4b}S(O)_2Cl$, or a sulfonic anhydride of Formula $(R_{4b}S(O)_2)_2O$ to provide a compound of Formula XVIII in which R_{1b} is $-X-Y-R_{4b}$, where Y is $-N(R_8)-Q-$, R_8 is as defined above, and Q is $-C(O)-$ or $-SO_2-$. Numerous acid chlorides, sulfonyl chlorides, and sulfonic anhydrides are commercially available; others can be readily prepared using
 10 known synthetic methods. The reaction can be conveniently carried out by adding an acid chloride of Formula $R_{4b}C(O)Cl$, a sulfonyl chloride of Formula $R_{4b}S(O)_2Cl$, or a sulfonic anhydride of Formula $(R_{4b}S(O)_2)_2O$ to a solution of a 3-nitroquinolin-4-amine of Formula XVIII, in which R_{1b} is R_{4b} having an amino substituent, and a base such as triethylamine in a suitable solvent such as
 15 dichloromethane. The reaction can be carried out at ambient temperature.

A 3-nitroquinolin-4-amine of Formula XVIII, in which R_{1b} is R_{4b} having an amino substituent, can also react with isocyanates of Formula $R_{4b}N=C=O$ to provide a compound of Formula XVIII in which R_{1b} is $-X-Y-R_{4b}$, where Y is $-N(R_8)-Q-$, R_8 is as defined above, and Q is $-C(R_6)-N(R_8)-W-$, R_6 is $=O$, and W is
 20 a bond. Numerous isocyanates of Formula $R_{4b}N=C=O$ are commercially available; others can be readily prepared using known synthetic methods. The reaction can be conveniently carried out by adding the isocyanate of Formula $R_{4b}N=C=O$ to a solution of the 3-nitroquinolin-4-amine of Formula XVIII, in which R_{1b} is R_{4b} having an amino substituent, in a suitable solvent such as
 25 dichloromethane. The reaction can be carried out at ambient temperature.

Alternatively, a compound of Formula XVIII can be treated with an isocyanate of Formula $R_{4b}(CO)N=C=O$, a thioisocyanate of Formula $R_{4b}N=C=S$, a sulfonyl isocyanate of Formula $R_{4b}S(O)_2N=C=O$, or a carbamoyl chloride of Formula $R_{4b}N-(R_8)-C(O)Cl$ or

to provide a compound of Formula XVIII, where R_{1b} is $-X-N(R_8)-Q-R_{4b}$ or

Q is $-C(R_6)-N(R_8)-W-$, and R_6 , R_8 , and W are as defined above. The product can then be treated according to steps (7) through (10) of Reaction Scheme II to provide 1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula XXII.

5 Compounds of the invention, where R_{1c} is $-X-Y-R_{4b}$ or $-X-R_5$; Y is $-N(R_8)-Q-$; R_5 is

and X , Q , R , R_2 , R_{3a} , R_{4b} , and n are as defined above can be prepared according to Reaction Scheme III. Steps (1) through (4) of Reaction Scheme III are carried out as described for steps (2) through (5) of Reaction Scheme II.

10 In step (5) of Reaction Scheme III, a 4-chloro-3-nitroquinoline of Formula XXVII is treated with a Boc-protected diamine of Formula $(CH_3)_3CO-C(O)-NH-X-NH_2$ to provide a protected 3-nitroquinolin-4-amine of Formula XXVIII. Several Boc-protected diamines of Formula

15 $(CH_3)_3CO-C(O)-NH-X-NH_2$ are commercially available; others can be prepared by known synthetic methods. The reaction is conveniently carried out by adding a solution of the Boc-protected diamine of Formula $(CH_3)_3CO-C(O)-NH-X-NH_2$ to a cooled solution of a 4-chloro-3-nitroquinoline of Formula XXVII in a suitable solvent such as dichloromethane in the presence of a tertiary amine such

20 as triethylamine. The reaction can be carried out at ambient temperature, and the product can be isolated using conventional methods.

25 In steps (6) and (7) of Reaction Scheme III, a 3-nitroquinolin-4-amine of Formula XXVIII is first reduced to provide a quinoline-3,4-diamine of Formula XXIX, which is converted to 1*H*-imidazo[4,5-*c*]quinoline of Formula XXX by reaction with a carboxylic acid equivalent. Steps (6) and (7) of Reaction Scheme III can be carried out as described for steps (7) and (8) of Reaction Scheme II. The sodium dithionite reduction in step (6) can also be conveniently carried out in a mixture of dichloromethane and water at ambient temperature in the presence of potassium carbonate and 1,1'-di-*n*-octyl-4,4'-bipyridinium

dibromide. In part (ii) of step (7), the cyclization can also be carried out in ethanol while heated at reflux.

In step (8) of Reaction Scheme III, the Boc-protecting group of a 1*H*-imidazo[4,5-*c*]quinoline of Formula XXX is removed to provide a 1*H*-imidazo[4,5-*c*]quinoline of Formula XXXI. The reaction is conveniently carried out by adding hydrochloric acid or a solution of hydrochloric acid in ethanol to a solution of a 1*H*-imidazo[4,5-*c*]quinoline of Formula XXX in a suitable solvent such as ethanol. The reaction can be carried out at an elevated temperature, for example, the reflux temperature of the solvent. The product or pharmaceutically acceptable salt thereof can be isolated by conventional methods.

In step (9) of Reaction Scheme III, an amino-substituted 1*H*-imidazo[4,5-*c*]quinoline of Formula XXXI is converted to a 1*H*-imidazo[4,5-*c*]quinolin-1-yl compound of Formula XXXII, where R_{1c} is as defined above, using conventional methods. For example, a 1*H*-imidazo[4,5-*c*]quinoline of Formula XXXI can react with an acid chloride of Formula $R_{4b}C(O)Cl$ to provide a compound of Formula XXXII in which R_{1c} is -X-Y- R_{4b} , Y is -N(R_8)-Q-, and Q is -C(O)-. In addition, a 1*H*-imidazo[4,5-*c*]quinoline of Formula XXXI can react with sulfonyl chloride of Formula $R_{4b}S(O)_2Cl$ or a sulfonic anhydride of Formula $(R_{4b}S(O)_2)_2O$ to provide a compound of Formula XXXII in which R_{1c} is -X-Y- R_{4b} , Y is -N(R_8)-Q-, and Q is -S(O)₂-. Numerous acid chlorides of Formula $R_{4b}C(O)Cl$, sulfonyl chlorides of Formula $R_{4b}S(O)_2Cl$, and sulfonic anhydrides of Formula $(R_{4b}S(O)_2)_2O$ are commercially available; others can be readily prepared using known synthetic methods. The reaction can be carried out as described above for a compound of Formula XVIII.

Ureas of Formula XXXII, where R_{1c} is -X-Y- R_{4b} , Y is -N(R_8)-Q-, Q is -C(R_6)-N(R_8)-W-, and W and R_8 are as defined above can be prepared by reacting a 1*H*-imidazo[4,5-*c*]quinoline of Formula XXXI with isocyanates of Formula $R_4N=C=O$ or Formula $R_4(CO)N=C=O$, thioisocyanates of Formula $R_4N=C=S$, sulfonyl isocyanates of Formula $R_4S(O)_2N=C=O$, or carbamoyl chlorides of Formula $R_4N-(R_8)-C(O)Cl$. Numerous compounds of these types are commercially available; others can be readily prepared using known

synthetic methods. The reaction can be carried out as described above for a compound of Formula XVIII.

Compounds of Formula XXXII where R_{1c} is $-X-R_5$ and R_5 is

- 5 can be prepared by treating an amino-substituted 1*H*-imidazo[4,5-*c*]quinoline of Formula XXXI with a chloroalkanesulfonyl chloride of Formula $Cl-R_7S(O)_2Cl$. The reaction is conveniently carried out by adding the chloroalkanesulfonyl chloride to a solution of the amino-substituted 1*H*-imidazo[4,5-*c*]quinoline of Formula XXXI in a suitable solvent such as chloroform at ambient temperature.
- 10 The isolable intermediate chloroalkanesulfonamide can then be treated with a base such as 1,8-diazabicyclo[5.4.0]undec-7-ene at ambient temperature in a suitable solvent such as DMF to effect the cyclization. The product can be isolated using conventional methods.

- In steps (10) and (11) of Reaction Scheme III, a 1*H*-imidazo[4,5-*c*]quinoline of Formula XXXII is oxidized to afford a 1*H*-imidazo[4,5-*c*]quinoline-5*N*-oxide of Formula XXXIII, which is aminated to provide a 1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula XXXIV. Steps (10) and (11) of Reaction Scheme III can be carried out as described for steps (9) and (10), respectively, of Reaction Scheme II.

- 20 In step (12) of Reaction Scheme III, a 1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula XXXIV undergoes a coupling reaction with boronic acid of Formula X, an anhydride thereof, or a boronic acid ester of Formula $R_{3a}-B(O\text{-alkyl})_2$. The Suzuki coupling reaction can be carried out as described in Reaction Scheme I to provide a 1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula
- 25 XXXV, which is a subgenus of Formula II. The product or pharmaceutically acceptable salt thereof can be isolated using conventional methods.

Reaction Scheme III

5 Compounds of the invention can also be prepared according to Reaction Scheme IV, where R, R₂, R_{3a}, R₄, R₁₀, X, and Q are as defined above. In step (1) of Reaction Scheme IV, a 4-chloro-3-nitroquinoline of Formula XXVII is treated with a Boc-protected diamine of Formula XXXVI to provide a 3-nitroquinolin-4-amine of Formula XXXVII. Boc-protected diamines of Formula XXXVII are

10 available from the method described by Carceller, E. et al, *J. Med. Chem.*, 39, 487-493 (1996). The reaction can be carried out as described for step (5) of Reaction Scheme III.

In steps (2)-(5) of Reaction Scheme IV, a 3-nitroquinolin-4-amine of Formula XXXVII is first reduced to provide a quinoline-3,4-diamine of Formula XXXVIII, which is converted to 1*H*-imidazo[4,5-*c*]quinoline of Formula XXXIX by reaction with a carboxylic acid equivalent. The 1*H*-imidazo[4,5-*c*]quinoline of Formula XXXIX is then oxidized to afford a 1*H*-imidazo[4,5-*c*]quinoline-5*N*-oxide of Formula XL, which is aminated to provide a 1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula XLI. Steps (2), (3), (4), and (5) of Reaction Scheme IV can be carried out as described for steps (7), (8), (9), and (10), respectively, of Reaction Scheme II.

In steps (6) of Reaction Scheme IV, the Boc protecting group of a 1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula XLI is removed to provide a 1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula XLII, which is converted to a 1*H*-imidazo[4,5-*c*]quinolinyl compound of Formula XLIII in step (7). Steps (6) and (7) of Reaction Scheme IV can be carried out as described for steps (8) and (9) of Reaction Scheme III.

In step (8), the compound of Formula XLIII is then coupled with a boronic acid of Formula X, an anhydride thereof, or boronic acid ester of Formula $R_{3a}\text{-B(O-alkyl)}_2$ to provide a 1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula XLIV, which is a subgenus of Formula II. The Suzuki coupling reaction can be carried out as described in Reaction Scheme I. In some embodiments, the coupling reaction shown in step (8) is carried out prior to the deprotection and functionalization reactions shown in steps (6) and (7) to provide a compound of Formula XLIV. The product or pharmaceutically acceptable salt thereof can be isolated using conventional methods.

Reaction Scheme IV

- The Heck reaction can be used to prepare compounds of the invention as shown in step (1) of Reaction Scheme V, wherein R₁, R₂, R, Hal, and n are as defined above and Ar_a is -Ar, -Ar'-Y-R₄, or -Ar'-X-Y-R₄. In step (1) of Reaction Scheme V, a halogen-substituted imidazoquinolin-4-amine of Formula IX is coupled with a vinyl-substituted compound of Formula L to provide an imidazoquinolin-4-amine of Formula LI, which is a subgenus of Formula II.
- Alternatively, a compound of Formula L can be coupled with a trifluoromethanesulfonate-substituted imidazoquinolin-4-amine, in which Hal in Formula IX is replaced by -OSO₂CF₃. Several compounds of Formula L are commercially available; others can be prepared by known methods. The reaction is conveniently carried out by combining the imidazoquinolin-4-amine

of Formula IX and the vinyl-substituted compound of Formula L in the presence of palladium (II) acetate, triphenylphosphine or tri-*ortho*-tolylphosphine, and a base such as triethylamine in a suitable solvent such as acetonitrile or toluene.

The reaction can be carried out at an elevated temperature such as 100-120 °C under an inert atmosphere. The compound or pharmaceutically acceptable salt thereof can be isolated using conventional methods.

In step (2) of Reaction Scheme V, the vinyl group of an imidazoquinolin-4-amine of Formula LI is reduced to provide an imidazoquinolin-4-amine of Formula LII, which is also a subgenus of Formula II. The reduction can be carried out by hydrogenation using a conventional heterogeneous hydrogenation catalyst such as palladium on carbon. The reaction can conveniently be carried out on a Parr apparatus in a suitable solvent such as ethanol, methanol, or mixtures thereof. The compound or pharmaceutically acceptable salt thereof can be isolated using conventional methods.

Reaction Scheme V

Palladium-catalyzed coupling reactions can also be used to prepare compounds of the invention according to Reaction Scheme VI, wherein R₁, R₂, R₉, R, Hal, Ar_a, and n are as defined above. In step (1) of Reaction Scheme VI, a halogen-substituted imidazoquinolin-4-amine of Formula IX undergoes a

Suzuki-type coupling with a potassium alkenyltrifluoroborate of Formula LIII to provide an imidazoquinolin-4-amine of Formula XLVII. The reaction is conveniently carried out by combining the imidazoquinolin-4-amine of Formula IX and a compound of Formula LIII, such as potassium vinyltrifluoroborate, in the presence of dichloro[1,1'-bis(diphenylphosphino)ferrocene]palladium (II) dichloromethane adduct and a base such as triethylamine in a suitable solvent such as *n*-propanol. The reaction can be carried out at an elevated temperature such as the reflux temperature of the solvent under an inert atmosphere. The compound or pharmaceutically acceptable salt thereof can be isolated using conventional methods.

In step (2) of Reaction Scheme VI, the Heck reaction is used to couple a vinylated imidazoquinolin-4-amine of Formula XLVII with an aryl or heteroaryl halide of Formula Ar_a-Hal or a trifluoromethanesulfonate of Formula Ar_a-OSO₂CF₃. Numerous compounds of Formula Ar_a-Hal are commercially available; others can be prepared using known synthetic methods. The reaction is conveniently carried out under the conditions described in step (1) of Reaction Scheme V to provide an imidazoquinolin-4-amine of Formula LI. The product or pharmaceutically acceptable salt thereof can be isolated using conventional methods.

In step (3) of Reaction Scheme VI, the vinyl group of an imidazoquinolin-4-amine of Formula LI is reduced to provide an imidazoquinolin-4-amine of Formula LII. The reaction is conveniently carried out by hydrogenation under the conditions described in step (2) of Reaction Scheme V.

Reaction Scheme VI

Dimers of the invention can be prepared according to Reaction Scheme VII, wherein R₁, R₂, Z, Hal, and Ar' are as defined above. In Reaction Scheme VII, a Suzuki coupling is carried out with an imidazoquinolin-4-amine of Formula LIV and a difunctional boronic acid of Formula LV, or an ester or anhydride thereof. Some boronic acids of Formula LV are commercially available; others can be prepared by known synthetic methods. The coupling can be carried out as described in Reaction Scheme I to provide a dimer of Formula XLVI. The compound or pharmaceutically acceptable salt thereof can be isolated using conventional methods.

Reaction Scheme VII

Compounds of the invention can also be prepared according to Reaction Scheme VIII, wherein R, R_{3a}, n, and Hal are as defined above, and R_{1d} and R_{2d} are subsets of R₁ and R₂ that do not include substituents that one skilled in the art would recognize as being susceptible to nucleophilic attack in step (5). These groups include, for example, esters and ureas. In step (1) of Reaction Scheme VIII, a nitro-substituted quinoline-2,4-diol of Formula LVI is chlorinated to provide a 2,4-dichloroquinoline of Formula LVII. Nitro-substituted quinoline-2,4-diols of Formula LVI can be prepared from substituted anilines according to the methods described in Buckle *et al*, *J. Med. Chem.*, 18, 726-732 (1975). The chlorination is conveniently carried out by heating the compound of Formula LVI and phenylphosphonic dichloride at an elevated temperature such as 140 °C. The reaction can be carried out without solvent, and the product can be isolated using conventional methods.

In step (2) of Reaction Scheme VIII, a 2,4-dichloroquinoline of Formula LVII is reacted with an amine of Formula R₁-NH₂ to provide a 2-chloro-3-nitroquinolin-4-amine of Formula LVIII. The reaction can be carried out as described in step (6) of Reaction Scheme II.

In step (3) of Reaction Scheme VIII, the nitro group of a 2-chloro-3-nitroquinolin-4-amine of Formula LVIII is reduced to provide a 2-chloroquinoline-3,4-diamine of Formula LIX. The reduction is conveniently

carried out with sodium dithionite according to the method described in step (7) of Reaction Scheme II.

In step (4) of Reaction Scheme VIII, a 2-chloroquinoline-3,4-diamine of Formula LIX is treated with a carboxylic acid or an equivalent thereof to provide
5 a 4-chloro-1*H*-imidazo[4,5-*c*]quinoline of Formula LX. The reaction can be carried out as described in step (8) of Reaction Scheme II.

In step (5) of Reaction Scheme VIII, a 4-chloro-1*H*-imidazo[4,5-*c*]quinoline of Formula LX is aminated to provide a 1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula LXI. The reaction is conveniently carried out by combining
10 the compound of Formula LX with a solution of ammonia in methanol in a bomb reactor and heating at an elevated temperature, such as 120 °C. The product or pharmaceutically acceptable salt thereof can be isolated using conventional methods.

In step (6) of Reaction Scheme VIII, a 1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula LXI undergoes a coupling reaction with a boronic acid of
15 Formula X, an anhydride thereof, or a boronic acid ester of Formula $R_{3a}\text{-B(O-alkyl)}_2$. The Suzuki coupling reaction can be carried out as described in Reaction Scheme I to provide a 1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula LXII, which is a subgenus of Formula II. The product or pharmaceutically
20 acceptable salt thereof can be isolated using conventional methods.

Reaction Scheme VIII

5 For some embodiments, compounds of the invention are prepared according to Reaction Scheme IX, where R, R₂, R_{3a}, R₄, X, Q, and n are as defined above. In step (1) of Reaction Scheme IX, a 4-chloro-3-nitroquinoline of Formula XXVII is treated with a Boc-protected piperazine of Formula LXIII to provide a 3-nitroquinolin-4-amine of Formula LXIV. The reaction can be

10 carried out as described for step (5) of Reaction Scheme III.

In steps (2) and (3) of Reaction Scheme IX, a 3-nitroquinolin-4-amine of Formula LXIV is first reduced to provide a quinoline-3,4-diamine of Formula LXV, which is converted to 1*H*-imidazo[4,5-*c*]quinoline of Formula LXVI by reaction with a carboxylic acid equivalent. Step (2) of Reaction Scheme IX can

15 be carried out as described for step (7) of Reaction Scheme II or step (8) of

Reaction Scheme III. Step (3) of Reaction Scheme IX can be carried out as described for step (8) of Reaction Scheme II.

5 The 1*H*-imidazo[4,5-*c*]quinoline of Formula LXVI is then oxidized in step (4) of Reaction Scheme IX to afford a dioxido-1*H*-imidazo[4,5-*c*]quinoline of Formula LXVII. The oxidation reaction is conveniently carried out in a similar manner to step (9) of Reaction Scheme II but with additional equivalents of 3-chloroperoxybenzoic acid. The product can be isolated using conventional methods.

10 In step (5) of Reaction Scheme IX, a dioxido-1*H*-imidazo[4,5-*c*]quinoline of Formula LXVII is aminated to provide a 1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula LXVIII. Step (5) of Reaction Scheme IX can be carried out as described for step (10) of Reaction Scheme II.

15 In step (6) of Reaction Scheme IX, the piperazine *N*-oxide of the 1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula LXVIII is reduced to provide a 1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula LXIX. The reaction is conveniently carried out by adding phosphorous trichloride to an *N*-oxide of Formula LXVIII in a suitable solvent such as chloroform. The reaction can be carried out at a subambient temperature, such as 4 °C. The product can be isolated using conventional methods.

20 In step (7) of Reaction Scheme IX, the Boc protecting group of a 1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula LXIX is removed to provide a 1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula LXX. The deprotection can be carried out as described in step (8) of Reaction Scheme III.

25 In step (8) of Reaction Scheme IX, a 1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula LXX is coupled with a boronic acid of Formula X, an anhydride thereof, or boronic acid ester of Formula R_{3a}-B(O-alkyl)₂ to provide a 1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula LXXI, which is a subgenus of Formula II. The Suzuki coupling reaction can be carried out as described in Reaction Scheme I. The product or pharmaceutically acceptable salt thereof can be isolated using conventional methods.

30 In step (9) of Reaction Scheme IX, a 1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula LXXI is converted to a 1*H*-imidazo[4,5-*c*]quinolinyl compound of

Formula LXXII. Step (9) can be carried out as described for step (9) of Reaction Scheme III, and the product or pharmaceutically acceptable salt thereof can be isolated using conventional methods.

5

Reaction Scheme IX

For certain embodiments, compounds of the invention can be prepared according to Reaction Scheme X, where R, R₂, R₄, Hal, and n are as defined above and X₁₋₁ is selected from the group consisting of C₁₋₁₀alkylene, C₄₋₁₀alkenylene, and C₄₋₁₀alkynylene, wherein the terminal carbon atoms of alkenylene and alkynylene are tetrahedral. In step (1) a 3-nitroquinolin-4-amine of Formula LXXIII is reduced to provide a quinoline-3,4-diamine of Formula LXXIV. The reaction can be carried out as in step (7) of Reaction Scheme II. The product or a pharmaceutically acceptable salt thereof can be isolated by conventional methods. Many 3-nitroquinolin-4-amines of Formula LXXIII are

known or can be prepared using known synthetic methods, see for example, U.S. Patent Nos. 4,689,338; 5,175,296; and 5,389,640; and the references cited therein.

5 In step (2) of Reaction Scheme X, a quinoline-3,4-diamine of Formula LXXIV is reacted with a carboxylic acid or an equivalent thereof to provide a 1*H*-imidazo[4,5-*c*]quinoline of Formula LXXV. The reaction can be conveniently carried out as described in step (8) of Reaction Scheme II. The product or a pharmaceutically acceptable salt thereof can be isolated by conventional methods.

10 In step (3) of Reaction Scheme X, a 1*H*-imidazo[4,5-*c*]quinoline of Formula LXXV is reacted with sodium hydride to form an alkoxide, which is reacted with a vinyl sulfone to provide a 1*H*-imidazo[4,5-*c*]quinoline of Formula LXXVI. The reaction can be carried out by adding catalytic sodium hydride dispersed in mineral oil to a solution of a 1*H*-imidazo[4,5-*c*]quinoline of
15 Formula LXXV and a vinyl sulfone of the formula $\text{CH}_2=\text{CH-S(O)}_2\text{-R}_4$ in a suitable solvent such as DMF or tetrahydrofuran. The reaction can be run at ambient temperature. The product or a pharmaceutically acceptable salt thereof can be isolated by conventional methods.

20 In step (4) of Reaction Scheme X, a 1*H*-imidazo[4,5-*c*]quinoline of Formula LXXVI is oxidized to provide an *N*-oxide of Formula LXXVII. The reaction can be conveniently carried out as in step (9) of Reaction Scheme II.

In step (5) an *N*-oxide of Formula LXXVII is aminated to provide a 1*H*-imidazo[4,5-*c*]quinoline-4-amine of Formula LXXVIII. The reaction is carried as in step (10) of Reaction Scheme II. The product or a pharmaceutically
25 acceptable salt thereof can be isolated by conventional methods.

In step (6) of Reaction Scheme X, a halogen-substituted 1*H*-imidazo[4,5-*c*]quinoline-4-amine of Formula LXXVIII undergoes a coupling reaction with a boronic acid of Formula X, an anhydride thereof, or a boronic acid ester of Formula $\text{R}_{3a}\text{-B(O-alkyl)}_2$. The Suzuki coupling reaction can be carried out as
30 described in Reaction Scheme I to provide a 1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula LXXIX, which is a subgenus of Formula II. The product or

pharmaceutically acceptable salt thereof can be isolated using conventional methods.

Reaction Scheme X

5

For other embodiments, compounds of the invention can be prepared according to Reaction Scheme XI, where R, R_2 , R_4 , R_8 , X, Hal, and n are as defined above. In step (1) of Reaction Scheme XI, the hydroxy group of a 3-nitroquinolin-4-amine of Formula LXXX is chlorinated using conventional methods to provide a 3-nitroquinolin-4-amine of Formula LXXXI. Many 3-nitroquinolin-4-amines of Formula LXXIII are known or can be prepared using known synthetic methods, see for example, U.S. Patent Nos. 4,689,338; 5,175,296; and 5,389,640; and the references cited therein. The chlorination is conveniently carried out by adding thionyl chloride to a solution of the 3-nitroquinolin-4-amine of Formula LXXX in a suitable solvent such as

dichloromethane. The reaction can be carried out at ambient temperature, and the product can be isolated using conventional methods.

In step (2) of Reaction Scheme XI, a 3-nitroquinolin-4-amine of Formula LXXXI is reduced to provide a quinoline-3,4-diamine of Formula LXXXII. The
5 reduction can be carried out with sodium dithionite as described in step (7) of Reaction Scheme II. The product can be isolated by conventional methods.

In step (3) of Reaction Scheme XI, a quinoline-3,4-diamine of Formula LXXXII is reacted with a carboxylic acid or an equivalent thereof to provide a
10 1*H*-imidazo[4,5-*c*]quinoline of Formula LXXXIII. The reaction can be conveniently carried out as described in step (8) of Reaction Scheme II; the product can be isolated by conventional methods.

In step (4) of Reaction Scheme XI, the chloro group of a 1*H*-imidazo[4,5-*c*]quinoline of Formula LXXXIII is displaced with potassium
15 thioacetate to provide a 1*H*-imidazo[4,5-*c*]quinoline of Formula LXXXIV. The reaction is conveniently carried out by adding potassium thioacetate to a solution of a 1*H*-imidazo[4,5-*c*]quinoline of Formula LXXXIII in a suitable solvent such as DMF. The reaction can be carried out at ambient temperature, and the product can be isolated using conventional methods.

In step (5) of Reaction Scheme XI, the thioacetate group of a 1*H*-imidazo[4,5-*c*]quinoline of Formula LXXXIV is hydrolyzed under basic
20 conditions to provide a thiol-substituted 1*H*-imidazo[4,5-*c*]quinoline of Formula LXXXV. The reaction is conveniently carried out by adding a solution of sodium methoxide in methanol to a solution of a 1*H*-imidazo[4,5-*c*]quinoline of Formula LXXXIV in methanol. The reaction can be carried out at ambient
25 temperature, and the product can be isolated using conventional methods.

In step (6) of Reaction Scheme XI, the thiol group of a 1*H*-imidazo[4,5-*c*]quinoline of Formula LXXXV is oxidized to a sulfonyl chloride of Formula
LXXXVI. The reaction is conveniently carried out by adding a solution of sodium chlorate in a suitable solvent such as water to a solution of a thiol-
30 substituted 1*H*-imidazo[4,5-*c*]quinoline of Formula LXXXV in hydrochloric acid. The reaction can be carried out at a subambient temperature such as 0 °C, and the product can be isolated using conventional methods.

Alternatively, steps (4), (5), and (6) can be replaced with steps (4a) and (5a) of Reaction Scheme XI. In step (4a), the chloro group of a 1*H*-imidazo[4,5-*c*]quinoline of Formula LXXXIII is displaced with thiourea to provide a 1*H*-imidazo[4,5-*c*]quinoline of Formula LXXXVII. The reaction is conveniently carried out by adding thiourea and a catalytic amount of potassium iodide to a solution of a 1*H*-imidazo[4,5-*c*]quinoline of Formula LXXXIII in a suitable solvent such as DMF. The reaction can be carried out at an elevated temperature, such as 110 °C, and the product can be isolated using conventional methods.

In step (5a) of Reaction Scheme XI, the thiourea group of a 1*H*-imidazo[4,5-*c*]quinoline of Formula LXXXVII is converted to a sulfonyl chloride of Formula LXXXVI under the conditions described in step (6).

In step (7) of Reaction Scheme XI, the sulfonyl chloride of Formula LXXXVI is treated with an amine or an amine salt to provide a sulfonamide of Formula LXXXVIII. The reaction is conveniently carried out by adding an amine of Formula NH(R₄)(R₈) to a sulfonyl chloride of Formula LXXXVI in a suitable solvent such as dichloromethane. The reaction can be carried out at ambient temperature, and the product can be isolated using conventional methods. Alternatively, step (7) can be carried out by adding an amine hydrochloride of Formula (R₄)(R₈)NH•HCl followed by aqueous potassium carbonate to a solution of a sulfonyl chloride of Formula LXXXVI in a suitable solvent such as dichloromethane. The reaction can be carried out at ambient temperature, and the product can be isolated using conventional methods.

In steps (8) and (9) of Reaction Scheme XI, a sulfonamide-substituted 1*H*-imidazo[4,5-*c*]quinoline of Formula LXXXVIII is oxidized in step (8) to afford a 1*H*-imidazo[4,5-*c*]quinoline-5*N*-oxide of Formula LXXXIX, which is aminated in step (9) to provide a 1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula XC. Steps (8) and (9) of Reaction Scheme XI can be carried out as described in steps (9) and (10) of Reaction Scheme II.

In step (10) of Reaction Scheme XI, a 1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula XC is coupled with a boronic acid of Formula X, an anhydride thereof, or boronic acid ester of Formula R_{3a}-B(O-alkyl)₂ to provide a 1*H*-

imidazo[4,5-*c*]quinolin-4-amine of Formula XCI, which is a subgenus of Formula II. Step (10) can be carried out as described in Reaction Scheme I. The product or pharmaceutically acceptable salt thereof can be isolated using conventional methods.

For other embodiments, compounds of the invention can be prepared according to Reaction Scheme XII, wherein R, R₁, R₂, Hal, and n are as defined above, and HA is a heteroaryl group attached at a nitrogen atom. In Reaction

Scheme XII, a halogen-substituted imidazoquinolin-4-amine of Formula IX undergoes a copper-catalyzed amination with a nitrogen-containing heteroaryl compound to provide an imidazoquinolin-4-amine of Formula XCII, which is a subgenus of Formula II. Several nitrogen-containing heteroaryl compounds, such as imidazole and pyrazole, are commercially available; others can be prepared by known methods. The reaction is conveniently carried out by combining the imidazoquinolin-4-amine of Formula IX and the nitrogen-containing heteroaryl compound in the presence of copper (I) iodide, potassium phosphate, and *trans*-1,2-diaminocyclohexane in a suitable solvent such as 1,4-dioxane. The reaction can be carried out at an elevated temperature such as 110 °C. The compound or pharmaceutically acceptable salt thereof can be isolated using conventional methods.

Pharmaceutical Compositions and Biological Activity

Pharmaceutical compositions of the invention contain a therapeutically effective amount of a compound of the invention as described above in combination with a pharmaceutically acceptable carrier.

The term "therapeutically effective amount" or "effective amount" means an amount of the compound sufficient to induce a therapeutic or prophylactic effect, such as cytokine induction, cytokine inhibition, immunomodulation, antitumor activity, and/or antiviral activity. Although the exact amount of active compound used in a pharmaceutical composition of the invention will vary according to factors known to those of skill in the art, such as the physical and chemical nature of the compound, the nature of the carrier, and the intended dosing regimen, it is anticipated that the compositions of the invention will contain sufficient active ingredient to provide a dose of about 100 ng/kg to about

50 mg/kg, preferably about 10 µg/kg to about 5 mg/kg, of the compound to the subject. A variety of dosage forms may be used, such as tablets, lozenges, capsules, parenteral formulations, syrups, creams, ointments, aerosol formulations, transdermal patches, transmucosal patches and the like.

5 The compounds of the invention can be administered as the single therapeutic agent in the treatment regimen, or the compounds of the invention may be administered in combination with one another or with other active agents, including additional immune response modifiers, antivirals, antibiotics, antibodies, proteins, peptides, oligonucleotides, etc.

10 Compounds of the invention have been shown to modulate (e.g., induce or inhibit) the production of certain cytokines in experiments performed according to the tests set forth below. These results indicate that compounds of the invention are useful as immune response modifiers that can modulate the immune response in a number of different ways, rendering them useful in the
15 treatment of a variety of disorders.

 Cytokines whose production may be induced by the administration of certain compounds according to the invention generally include interferon-α (IFN-α) and/or tumor necrosis factor-α (TNF-α) as well as certain interleukins (IL). Cytokines whose biosynthesis may be induced by certain compounds of
20 the invention include IFN-α, TNF-α, IL-1, IL-6, IL-10 and IL-12, and a variety of other cytokines. Among other effects, these and other cytokines can inhibit virus production and tumor cell growth, making the compounds useful in the treatment of viral diseases and neoplastic diseases. Accordingly, the invention provides a method of inducing cytokine biosynthesis in an animal comprising
25 administering an effective amount of a compound or composition of the invention to the animal. The animal to which the compound or composition is administered for induction of cytokine biosynthesis may have a disease as described *infra*, for example a viral disease or a neoplastic disease, and administration of the compound may provide therapeutic treatment.
30 Alternatively, the compound may be administered to the animal prior to the animal acquiring the disease so that administration of the compound may provide a prophylactic treatment.

In addition to the ability to induce the production of cytokines, certain compounds of the invention affect other aspects of the innate immune response. For example, natural killer cell activity may be stimulated, an effect that may be due to cytokine induction. Certain compounds may also activate macrophages,
5 which in turn stimulate secretion of nitric oxide and the production of additional cytokines. Further, certain compounds may cause proliferation and differentiation of B-lymphocytes.

Certain compounds of the invention also have an effect on the acquired immune response. For example, the production of the T helper type 1 (T_H1) cytokine IFN- γ is induced indirectly and the production of the T helper type 2
10 (T_H2) cytokines IL-4, IL-5 and IL-13 are inhibited upon administration of compounds of the invention.

Other cytokines whose production is inhibited by the administration of certain compounds according to the invention include tumor necrosis factor- α (TNF- α). Among other effects, inhibition of TNF- α production can provide
15 prophylaxis or therapeutic treatment of diseases in animals in which TNF is mediated, making the compounds useful in the treatment of, for example, autoimmune diseases. Accordingly, the invention provides a method of inhibiting TNF- α biosynthesis in an animal comprising administering an
20 effective amount of a compound or composition of the invention to the animal. The animal to which the compound or composition is administered for inhibition of TNF- α biosynthesis may have a disease as described *infra*, for example an autoimmune disease, and administration of the compound may provide therapeutic treatment. Alternatively, the compound may be administered to the
25 animal prior to the animal acquiring the disease so that administration of the compound may provide a prophylactic treatment.

Whether for prophylaxis or therapeutic treatment of a disease, and whether for effecting innate or acquired immunity, the compound or composition may be administered alone or in combination with one or more active
30 components as in, for example, a vaccine adjuvant. When administered with other components, the compound and other component or components may be administered separately; together but independently such as in a solution; or

together and associated with one another such as (a) covalently linked or (b) non-covalently associated, e.g., in a colloidal suspension.

Conditions for which IRMs identified herein may be used as treatments include, but are not limited to:

- 5 (a) viral diseases such as, for example, diseases resulting from infection by an adenovirus, a herpesvirus (e.g., HSV-I, HSV-II, CMV, or VZV), a poxvirus (e.g., an orthopoxvirus such as variola or vaccinia, or molluscum contagiosum), a picornavirus (e.g., rhinovirus or enterovirus), an orthomyxovirus (e.g., influenzavirus), a paramyxovirus (e.g., parainfluenzavirus, mumps virus, 10 measles virus, and respiratory syncytial virus (RSV)), a coronavirus (e.g., SARS), a papovavirus (e.g., papillomaviruses, such as those that cause genital warts, common warts, or plantar warts), a hepadnavirus (e.g., hepatitis B virus), a flavivirus (e.g., hepatitis C virus or Dengue virus), or a retrovirus (e.g., a lentivirus such as HIV);

- (c) other infectious diseases, such chlamydia, fungal diseases including but not limited to candidiasis, aspergillosis, histoplasmosis, cryptococcal meningitis, or parasitic diseases including but not limited to malaria, 25 *pneumocystis carinii* pneumonia, leishmaniasis, cryptosporidiosis, toxoplasmosis, and trypanosome infection; and
- (d) neoplastic diseases, such as intraepithelial neoplasias, cervical dysplasia, actinic keratosis, basal cell carcinoma, squamous cell carcinoma, renal cell carcinoma, Kaposi's sarcoma, melanoma, renal cell carcinoma, leukemias 30 including but not limited to myelogenous leukemia, chronic lymphocytic leukemia, multiple myeloma, non-Hodgkin's lymphoma, cutaneous T-cell lymphoma, B-cell lymphoma, and hairy cell leukemia, and other cancers; and

(e) T_H2-mediated, atopic, and autoimmune diseases, such as atopic dermatitis or eczema, eosinophilia, asthma, allergy, allergic rhinitis, systemic lupus erythematosus, essential thrombocythaemia, multiple sclerosis, Ommen's syndrome, discoid lupus, alopecia areata, inhibition of keloid formation and other types of scarring, and enhancing wound healing, including chronic wounds.

IRMs identified herein also may be useful as a vaccine adjuvant for use in conjunction with any material that raises either humoral and/or cell mediated immune response, such as, for example, live viral, bacterial, or parasitic immunogens; inactivated viral, tumor-derived, protozoal, organism-derived, fungal, or bacterial immunogens, toxoids, toxins; self-antigens; polysaccharides; proteins; glycoproteins; peptides; cellular vaccines; DNA vaccines; recombinant proteins; glycoproteins; peptides; and the like, for use in connection with, for example, BCG, cholera, plague, typhoid, hepatitis A, hepatitis B, hepatitis C, influenza A, influenza B, parainfluenza, polio, rabies, measles, mumps, rubella, yellow fever, tetanus, diphtheria, hemophilus influenza b, tuberculosis, meningococcal and pneumococcal vaccines, adenovirus, HIV, chicken pox, cytomegalovirus, dengue, feline leukemia, fowl plague, HSV-1 and HSV-2, hog cholera, Japanese encephalitis, respiratory syncytial virus, rotavirus, papilloma virus, yellow fever, and Alzheimer's Disease.

IRMs may also be particularly helpful in individuals having compromised immune function. For example, IRM compounds may be used for treating the opportunistic infections and tumors that occur after suppression of cell mediated immunity in, for example, transplant patients, cancer patients and HIV patients.

Thus, one or more of the above diseases or types of diseases, for example, a viral disease, a neoplastic disease, may be treated in an animal in need thereof (having the disease) by administering a therapeutically effective amount of a compound or salt of Formula I, II, III, IV, V, VI, VII, VIII, XLVI, or a combination thereof to the animal.

An amount of a compound effective to induce or inhibit cytokine biosynthesis is an amount sufficient to cause one or more cell types, such as monocytes, macrophages, dendritic cells and B-cells to produce an amount of

one or more cytokines such as, for example, IFN- α , TNF- α , IL-1, IL-6, IL-10 and IL-12 that is increased (induced) or decreased (inhibited) over a background level of such cytokines. The precise amount will vary according to factors known in the art but is expected to be a dose of about 100 ng/kg to about 50 mg/kg, preferably about 10 μ g/kg to about 5 mg/kg. The invention also provides a method of treating a viral infection in an animal and a method of treating a neoplastic disease in an animal comprising administering an effective amount of a compound or composition of the invention to the animal. An amount effective to treat or inhibit a viral infection is an amount that will cause a reduction in one or more of the manifestations of viral infection, such as viral lesions, viral load, rate of virus production, and mortality as compared to untreated control animals. The precise amount that is effective for such treatment will vary according to factors known in the art but is expected to be a dose of about 100 ng/kg to about 50 mg/kg, preferably about 10 μ g/kg to about 5 mg/kg. An amount of a compound effective to treat a neoplastic condition is an amount that will cause a reduction in tumor size or in the number of tumor foci. Again, the precise amount will vary according to factors known in the art but is expected to be a dose of about 100 ng/kg to about 50 mg/kg, preferably about 10 μ g/kg to about 5 mg/kg.

In addition to the formulations and uses described specifically herein, other formulations, uses, and administration devices suitable for compounds of the present invention are described in, for example, International Publication Nos. WO 03/077944, WO 03/080114, WO 03/045494, WO 02/024225, WO 02/036592, U.S. Patent No. 6,245,776, and U.S. Publication Nos. 2002/0193729 and 2003/0139364.

Objects and advantages of this invention are further illustrated by the following examples, but the particular materials and amounts thereof recited in these examples, as well as other conditions and details, should not be construed to unduly limit this invention.

EXAMPLES

In the examples below some of the compounds were purified by preparative high performance liquid chromatography (prep HPLC) using a Waters Fraction Lynx automated purification system. The prep HPLC fractions
5 were analyzed using a Micromass LC-TOFMS and the appropriate fractions were combined and centrifuge evaporated to provide the trifluoroacetate salt of the desired compound. In order to maximize purity, the compounds were sent through the purification process twice. Column: Phenomenex Luna C18(2), 21.2 x 50 millimeters (mm), 10 micron particle size, 100 Angstrom (Å) pore; flow
10 rate: 25 milliliters per minutes (mL/min); non-linear gradient elution from 5-95% B in 9 min (first purification run) and from 5-65% B in 16 min (second purification run), then hold at 95% B for 2 min, where A is 0.05% trifluoroacetic acid/water and B is 0.05% trifluoroacetic acid/acetonitrile; fraction collection by mass-selective triggering.

15 A variety of chromatographic conditions were used for the prep HPLC purification of other compounds shown in the examples below using either the Phenomenex Luna C18(2) column (21.2 x 50 millimeters (mm), 10 micron particle size) or a Waters Xterra C18 column (19 x 50 mm, 5 micron particle size). Elution was carried out in a non-linear gradient from 95:5 to 5:95 A:B,
20 where A is 0.05% trifluoroacetic acid/water and B is 0.05% trifluoroacetic acid/acetonitrile; fraction collection was performed by mass-selective triggering.

Some of the compounds prepared by Suzuki coupling were passed through a Waters Oasis Sample Extractions Cartridge MCX (6 cc) prior to prep HPLC purification. The following procedure was used. The product from the
25 coupling reaction was dissolved in 1N hydrochloric acid (3 mL) to adjust to pH 5-7 and passed through the cartridge optionally using light nitrogen pressure. The cartridge was washed with methanol (5 mL) optionally using light nitrogen pressure and transferred to a clean test tube. A solution of 1% ammonia in methanol (2 x 5 mL) was then passed through the cartridge optionally using light
30 nitrogen pressure, and the basic solution was collected and concentrated.

Part A

A mixture of triethyl orthoformate (154 grams (g), 1.04 moles (mol) and Meldrum's acid (142 g, 0.983 mol) was heated to 55°C for 4 hours (h). After cooling to 50°C, a solution of 3-bromoaniline (162.6 g, 0.945 mol) in ethanol (300 mL) was added such that the temperature of the reaction was maintained between 50-55°C. After half of the 3-bromoaniline had been added, stirring became difficult due to the formation of solids, so more ethanol (1 liter (L)) was added to facilitate stirring. Upon complete addition, the reaction was cooled to room temperature (RT), and the solids were collected by filtration. The filter cake was washed with ice cold ethanol until the washings were nearly colorless, and the product was dried at 65°C under vacuum to afford 287 g of 5-[(3-bromophenylamino)methylene]-2,2-dimethyl-[1,3]dioxane-4,6-dione as an off-white solid.

Part A

A solution of 7-bromo-N⁴-isobutylquinoline-3,4-diamine (85 g, prepared according to Part F of Example 1) in anhydrous pyridine (413 mL) was immersed in an ice bath, and ethoxyacetyl chloride (36.9 g, 300 mmol) was added. Part A

A solution of 3-bromoaniline (344 g, 2.00 mol) and phenyl boronic acid (268 g, 2.2 mol) in *n*-propanol (3.5 L) was sparged with N₂ for 10 min. To this solution was added Pd(OAc)₂ (1.35 g, 6.0 mmol), triphenylphosphine (4.72 g, 18.0 mmol), Na₂CO₃ (1.2 L of a 2 M solution, 2.4 mol), and H₂O (700 mL). The reaction was brought to reflux under a N₂ atmosphere over a period of 45 min and then cooled to RT and transferred to a separatory funnel. The clear aqueous layer was drawn off (1.1 L), and the organic layer was washed with brine (3x500 mL). The organic layer was treated with charcoal (90 g of Darco G-60) and MgSO₄ (160 g) and was filtered through CELITE filter agent, washing with ethyl acetate. The filtrate was concentrated (420 g of an orange oil), dissolved in 1.1 L of 1/1 hexane/isopropanol, filtered to remove insoluble solid and then diluted with an additional 1.9 L of 1/1 hexane/isopropanol. The resulting solution was cooled in an ice bath and then anhydrous HCl in ether (1.05 L of a 2 M solution, 2.1 mol) was added. The solid was collected by filtration, washed with 700 mL diethyl ether (Et₂O), and dried at RT in a vacuum oven to obtain 345 g of the HCl salt of biphenyl-3-ylamine as yellow crystals. The free base was obtained by shaking the solid with *tert*-butyl methyl ether and 1 N NaOH followed by isolation in the usual fashion.

5-(Biphenyl-3-ylaminomethylene)-2,2-dimethyl-[1,3]dioxane-4,6-dione (160.2 g, 496 mmol) was dissolved in 800 mL of DOWTHERM A heat transfer fluid at 100°C and added over 40 min by way of a cannula line to 1.3 L of preheated DOWTHERM A heat transfer fluid to 215°C. After complete addition, the reaction was held at 215°C for 90 min and then cooled to RT. The resulting solid was collected by filtration, sequentially washed with diethyl ether (1.7 L) and acetone (500 mL), and then dried in a vacuum oven at 70°C overnight. The resulting product (74.5 g) contained approximately 5% of the undesired isomer. This product was combined with material from a separate run (51.4 g) and slurried in 440 mL of refluxing ethanol. Filtration of the slurry while hot followed by sequential ethanol and diethyl ether rinses afforded 106.1 g of 7-phenylquinolin-4-ol as a tan solid.

Part A

To a solution of 2-ethyl-1-isobutyl-1*H*-imidazo[4,5-*c*]quinolin-4-amine (805 mg, 3.00 mmol) in acetic acid (10 mL) was added Br₂ (719 mg, 4.50 mmol), and after 20 h, the resulting solid was collected by filtration and washed with H₂O. The orange solid was suspended in NaHSO₃ (25 mL of a saturated solution) and stirred for 23 h, after which it was again collected and stirred with NaHCO₃ (20 mL of a saturated solution) and CH₂Cl₂. Examples 20 – 65

The compounds in the table below were prepared according to the following method. 8-Bromo-1-isobutyl-1*H*-imidazo[4,5-*c*]quinoline-4-amine (25 mg) was dissolved in 1:1 volume:volume (v:v) dichloromethane:methanol. An aliquot (2 mL, 1.0 equivalents (eq.)) was placed in a 2 dram (7.4 mL) vial.

15

The solvent was removed by vacuum centrifugation. The vial was charged with the appropriate boronic acid (1.25 eq.), palladium (II) acetate (0.1 eq.), and *n*-propanol (900 μL) and then sonicated for 30 seconds. The vial was then charged with 2M aqueous sodium carbonate solution (313 μL), deionized water (63 μL), and a solution of triphenylphosphine in *n*-propanol (63 μL , 0.15 eq.). The vial

20

was capped and then heated to 80°C for 5 hours in a sand bath. The vial was allowed to cool to room temperature and then the solvent was removed by vacuum centrifugation. The residue was purified by preparative high performance liquid chromatography using the method described above to provide the trifluoroacetate salt of the desired compound. The table below

3-Bromo-5-(*tert*-butyldimethylsilyloxymethyl)pyridine was prepared according to the published procedure (Zhang, N. et al, *J. Med. Chem.*, 45, 2832-2840 (2002)). Under a nitrogen atmosphere, a solution of 3-bromo-5-(*tert*-butyldimethylsilyloxymethyl)pyridine (28.70 g, 94.94 mmol) and triisopropyl borate (26.3 mL, 114 mmol) in dry THF was cooled to -70 °C. *n*-Butyllithium (45.6 mL, 114 mmol) was added dropwise over a period of 1.5 hours. A solution of (5-bromopyridin-3-yl)methanol (7.39 g, 39.3 mmol) in THF was cooled to 0 °C. Sodium bis(trimethylsilyl)amide (39.3 mL of a 1.0 M solution in THF) was added, and the reaction was stirred for 20 minutes. Iodoethane (3.46 mL, 43.2 mmol) and DMF were added, and the reaction was allowed to warm to ambient temperature and stirred overnight. Brine was added, and the aqueous layer was extracted twice with hexanes. The combined organic fractions were concentrated under reduced pressure, and the residue was purified by HPFC (eluting with hexanes:ethyl acetate in a gradient from 100:0 to 70:30) to provide 5.11 g of 3-bromo-5-ethoxymethylpyridine as a colorless oil.

5 product was purified by flash chromatography on silica gel (eluting sequentially with 90:10 and 85:15 chloroform:CMA) to provide 23.6 g of *tert*-butyl [4-(7-bromo-2-ethoxymethyl-1*H*-imidazo[4,5-*c*]quinolin-1-yl)butyl]carbamate as a tan solid.

Part E

10 Concentrated hydrochloric acid (15.6 mL, 0.194 mol) was added to a solution of *tert*-butyl [4-(7-bromo-2-ethoxymethyl-1*H*-imidazo[4,5-*c*]quinolin-1-yl)butyl]carbamate (23.2 g, 48 mmol) in ethanol, and the reaction was heated at reflux for 20 minutes. A precipitate formed, and the reaction was allowed to cool to ambient temperature overnight. The solid was isolated by filtration,
15 washed with ethanol, and dissolved in water. The solution was washed with dichloromethane and then made basic with the addition of 50% aqueous sodium hydroxide. The basic solution was extracted with dichloromethane (3 x 300 mL), and the combined extracts were dried over magnesium sulfate, filtered, and concentrated under reduced pressure to provide 17 g of 4-(7-bromo-2-ethoxymethyl-1*H*-imidazo[4,5-*c*]quinolin-1-yl)butylamine as an off-white solid.

Part F

3-Chloropropanesulfonyl chloride (5.45 mL, 44.8 mmol) was added dropwise over a period of four minutes to a solution of 4-(7-bromo-2-ethoxymethyl-1*H*-imidazo[4,5-*c*]quinolin-1-yl)butylamine (16.9 g, 44.8 mmol)
25 and triethylamine (9.42 mL, 67.6 mmol) in dichloromethane (300 mL), and the reaction was stirred at ambient temperature for 30 minutes. The reaction was poured into water, and the organic layer was washed with brine and dried over magnesium sulfate, filtered, and concentrated under reduced pressure. The resulting solid was dissolved in *N,N*-dimethylformamide (DMF) (300 mL), and
30 1,8-diazabicyclo[5.4.0]undec-7-ene (DBU) (10.1 mL, 67.6 mmol) was added. The reaction was stirred overnight at ambient temperature under a nitrogen atmosphere. Additional DBU (5 mL) was added, and the reaction was stirred for

an additional four hours. The solvent was removed under reduced pressure, and the residue was dissolved in dichloromethane. The resulting solution was washed with water (2 x 200 mL) and brine, dried over magnesium sulfate, filtered, and concentrated under reduced pressure to provide 7-bromo-1-[4-(1,1-dioxidoisothiazolidin-2-yl)-2-ethoxymethyl]-1*H*-imidazo[4,5-*c*]quinoline as an oil.

The oxidation was carried out in chloroform, and several equivalents of 3-chloroperoxybenzoic acid were used. The product from amination was purified by column chromatography on silica gel (eluting with chloroform:CMA in a gradient from 98:2 to 85:15) followed by recrystallization from acetonitrile to provide 7-bromo-1-[4-(1,1-dioxidoisothiazolidin-2-yl)-2-ethoxymethyl]-1*H*-imidazo[4,5-*c*]quinolin-4-amine as a white solid.

The reaction was heated at reflux until an analysis by HPLC indicated the reaction was complete. The work-up procedure described in Part F of Examples 125-135 was followed, and the crude product was purified by column chromatography on silica gel (eluting with a gradient of chloroform:CMA) followed by recrystallization using the solvent indicated in the table below.

For Example 155, the reaction was heated at reflux for three hours. Following chromatographic purification, the residue was deprotected according to the method described in Example 144, purified by column chromatography, and recrystallized from acetonitrile.

For Example 156, the coupling was carried out using tri(*ortho*-tolyl)phosphine instead of triphenylphosphine.

Examples 477-480

Part A

Ammonium hydroxide (1 L) was added to a solution of methyl tetrahydropyranyl acetate (20 mL, 150 mmol) in methanol (500 mL), and the reaction was stirred overnight at ambient temperature. Additional ammonium hydroxide (500 mL) was added, and the reaction was stirred for four additional days. The methanol was removed under reduced pressure. Solid sodium

25

chloride was added to the aqueous layer, which was extracted with chloroform (3 x 150 mL). The combined extracts were dried over sodium sulfate, filtered, and concentrated under reduced pressure to provide 11.4 g of tetrahydropyran-4-carboxamide as a white solid.

5 Part B

A solution of tetrahydropyran-4-carboxamide (11.4 g, 88.3 mmol) in THF (441 mL) was cooled to 0 °C. Lithium aluminum hydride (10.0 g, 265 mmol) was added in six portions over a period of ten minutes. The reaction flask was purged with nitrogen between the additions. When the reaction mixture was no longer bubbling, it was heated at reflux for six hours. The reaction was then cooled to 0 °C, and ethyl acetate was added dropwise until bubbling ceased. Methanol was then added dropwise until bubbling ceased. Water (10 mL), 15% aqueous sodium hydroxide (10 mL), and water (30 mL) were sequentially added. The organic fraction was decanted off, and the remaining gray solid was washed with chloroform. The combined organic fractions were dried over sodium sulfate, filtered, and concentrated under reduced pressure to provide C-(tetrahydropyran-4-yl)methylamine.

15 Part C

The method described in Part E of Examples 431-436 was used to treat 7-bromo-4-chloro-3-nitroquinoline (12.43 g, 43.45 mmol) with C-(tetrahydropyran-4-yl)methylamine (10 g, 87 mmol) to provide 15.0 g of (7-bromo-3-nitroquinolin-4-yl)(tetrahydropyran-4-ylmethyl)amine as a bright yellow solid.

Part D

Part E

30 The material from Part D was treated with ethoxyacetyl chloride (5.5 mL, 48 mmol) according to the method described in Part A of Example 9. The reaction was heated overnight, and after the work-up procedure, the crude

Part F

5 The method described in Part J of Example 365 was used to oxidize and aminate 7-bromo-2-ethoxymethyl-1-(tetrahydropyran-4-ylmethyl)-1*H*-imidazo[4,5-*c*]quinoline (9.3 g, 23.0 mmol). 3-Chloroperoxybenzoic acid (7.9 g of 50% pure material, 23 mmol) was added in five portions during the oxidation step, which was stirred overnight. Additional 3-chloroperoxybenzoic acid (200
10 mg) was added, and the reaction was stirred for 20 minutes before ammonium hydroxide (60 mL) and *p*-toluenesulfonyl chloride (6.58 g, 34.5 mmol) were added. The crude product was obtained as an oil, which was treated with acetonitrile to form a precipitate. The precipitate was isolated by filtration and purified by HPFC (eluting with chloroform:CMA in a gradient from 100:0 to
15 80:20) to provide 6.0 g of 7-bromo-2-ethoxymethyl-1-(tetrahydropyran-4-ylmethyl)-1*H*-imidazo[4,5-*c*]quinolin-4-amine as a white solid, mp 186-188 °C.

20 below were coupled according to the general methods described in Part J of Example 1 and Part F of Examples 125-135. Palladium (II) acetate was added as a 5 mg/mL solution in toluene, and the reaction was heated overnight. The crude product was purified by HPFC (eluting with chloroform:CMA in a gradient from 100:0 to 70:30). The resulting oil was stirred with a small amount of acetonitrile
25 to provide a solid, which was isolated by filtration. For Examples 477 and 478, the solid was recrystallized twice from acetonitrile to provide the product shown in the table below. For Examples 479 and 480, the solid was allowed to dry in the filter funnel to provide the product shown in the table below.

5 A thick walled glass tube, equipped with magnetic stir-bar, was charged with toluene (20 mL/g), palladium (II) acetate (0.1 equivalents), tri-*ortho*-tolylphosphine (0.3 equivalents), triethylamine (3.0 equivalents), 2-vinylpyridine (1.0 equivalent), and 7-bromo-2-ethoxymethyl-1-(3-methoxypropyl)-1*H*-imidazo[4,5-*c*]quinolin-4-amine (1.0 eq.). The tube was purged with nitrogen and sealed. The reaction mixture was heated at 120 °C for 24-48 hours. The reaction mixture was allowed to cool and then concentrated under reduced pressure. The solid residue was partitioned between dichloromethane and water, and the mixture was adjusted to pH 12 with the addition of 10% aqueous sodium hydroxide. The organic layer was separated and purified by flash chromatography on silica gel (eluting with chloroform:methanol in a gradient from 100:0 to 90:10) followed by recrystallization from acetonitrile to provide (*E*)-2-ethoxymethyl-1-(3-methoxypropyl)-7-(2-pyridin-2-ylvinyl)-1*H*-imidazo[4,5-*c*]quinolin-4-amine as an off-white solid.

Part A

Cyclopentanecarbonyl chloride (0.80 mL, 6.6 mmol) was added dropwise over a period of five minutes to a suspension of 1-(4-aminobutyl)-7-bromo-2-ethoxymethyl-1*H*-imidazo[4,5-*c*]quinolin-4-amine (2.00 g, 5.1 mmol) and triethylamine (0.78 mL, 5.6 mmol) in chloroform (200 mL). Part A

A suspension of 1-(4-aminobutyl)-7-bromo-2-propyl-1*H*-imidazo[4,5-
 5 c]quinolin-4-amine (3.27 g, 8.7 mmol) and triethylamine (3.82 mL, 11.3 mmol) in
 chloroform (165 mL) was cooled to 0 °C. A cold solution of methanesulfonyl
 chloride (1.37 mL, 9.6 mmol) in chloroform (10 mL) was slowly added. The
 reaction was allowed to warm to ambient temperature after 15 minutes. Additional
 triethylamine (3.74 mL) and methanesulfonyl chloride (2.12 mL) were added over
 10 the course of several days to drive the reaction to completion. The reaction was
 concentrated under reduced pressure, and the residue was partitioned between 1%
 aqueous sodium carbonate and chloroform. The aqueous layer was adjusted to pH
 13 with the addition of saturated aqueous sodium bicarbonate and 50% aqueous
 sodium hydroxide. The precipitate was isolated by filtration, air-dried, and
 15 combined with material from another run. The crude product was recrystallized
 from isopropanol:water (15 mL/g:1.5 mL/g) and dried in a drying oven for several
 days to provide 1.48 g of *N*-(4-[4-amino-7-bromo-2-propyl-1*H*-imidazo[4,5-

Examples 956-981

Part A

1-(4-Amino-7-bromo-2-ethoxymethyl-1*H*-imidazo[4,5-*c*]quinolin-1-yl)-2-methylpropan-2-ol (2.62 g, 6.67 mmol) and 3-(*N*-*tert*-butoxycarbonylaminomethyl)phenylboronic acid (2.0 g, 8.0 mmol) were coupled according to the procedure described in Part J of Example 1. Palladium (II) acetate was added as a 5 mg/mL solution in toluene. The reaction was heated for four hours, and the work-up procedure described in Examples 125-135 was followed. The crude product was purified by HPFC (eluting with chloroform:CMA in a gradient from 100:0 to 80:20) to provide 2.94 g of *tert*-butyl {3-[4-amino-2-

ethoxymethyl-1-(2-hydroxy-2-methylpropyl)-1*H*-imidazo[4,5-*c*]quinolin-7-yl]benzyl} carbamate as a white solid.

Part B

Hydrogen chloride (30 mL of a 3 M solution in ethanol) was added to the material from Part A, and the reaction was heated at reflux for 30 minutes. A precipitate formed. Diethyl ether was added, and the precipitate was isolated by filtration, washed with diethyl ether, and air-dried to provide an off-white solid. The solid was partitioned between 2 M aqueous sodium carbonate, brine, and chloroform. The aqueous layer was extracted with chloroform. The combined organic fractions were dried over magnesium sulfate, filtered, and concentrated under reduced pressure. The residue was purified by HPFC (eluting with chloroform:CMA in a gradient from 100:0 to 50:50). The resulting white solid was recrystallized from acetonitrile, isolated by filtration, washed with cold acetonitrile, and air-dried to provide 1.7 g of 1-[4-amino-7-(3-aminomethylphenyl)-2-ethoxymethyl-1*H*-imidazo[4,5-*c*]quinolin-1-yl]-2-methylpropan-2-ol as a white solid.

Part C

The test tube was capped and placed on a shaker at ambient temperature overnight. The solvent was removed by vacuum centrifugation. The products were purified by prep HPLC according to the methods described above. CYTOKINE INDUCTION IN HUMAN CELLS

5 Many compounds of the invention have been found to modulate cytokine biosynthesis by inducing the production of interferon α and/or tumor necrosis factor α when tested using the method described below. Particular examples include but are not limited to the compounds of Examples 1-10, 12, 16, 18-21, 24-31, 43, 44, 51, 54, 55, 63, 66-101, 103-117, 119, 121-203, 205-390, 392-400, 403-407, 409-
 10 412, 414-418, 420, 425, 426, 428, 430-440, 442-446, 464-466, 468, 472-474, 476, 493, 494, 508-663, 807-830, 832-837, 839-841, 843, 844, 847-849, 852, 856, 858, 860-916, and 922-955.

An in vitro human blood cell system is used to assess cytokine induction. Activity is based on the measurement of interferon and tumor necrosis factor (α)
 15 (IFN and TNF, respectively) secreted into culture media as described by Testerman et. al. in "Cytokine Induction by the Immunomodulators Imiquimod and S-27609", *Journal of Leukocyte Biology*, 58, 365-372 (September, 1995).

Blood Cell Preparation for Culture

Whole blood from healthy human donors is collected by venipuncture into EDTA vacutainer tubes. Peripheral blood mononuclear cells (PBMC) are separated from whole blood by density gradient centrifugation using HISTOPAQUE-1077. Blood is diluted 1:1 with Dulbecco's Phosphate Buffered Saline (DPBS) or Hank's
5 Balanced Salts Solution (HBSS). The PBMC layer is collected and washed twice with DPBS or HBSS and resuspended at 4×10^6 cells/mL in RPMI complete. The PBMC suspension is added to 48 well flat bottom sterile tissue culture plates (Costar, Cambridge, MA or Becton Dickinson Labware, Lincoln Park, NJ) containing an equal volume of RPMI complete media containing test compound.

10

Compound Preparation

The compounds are solubilized in dimethyl sulfoxide (DMSO). The DMSO concentration should not exceed a final concentration of 1% for addition to the culture wells. The compounds are generally tested at concentrations ranging from
15 30-0.014 μ M.

Incubation

The solution of test compound is added at 60 μ M to the first well containing RPMI complete and serial 3 fold dilutions are made in the wells. The PBMC
20 suspension is then added to the wells in an equal volume, bringing the test compound concentrations to the desired range (30-0.014 μ M). The final concentration of PBMC suspension is 2×10^6 cells/mL. The plates are covered with sterile plastic lids, mixed gently and then incubated for 18 to 24 hours at 37°C in a 5% carbon dioxide atmosphere.

25

Separation

Following incubation the plates are centrifuged for 10 minutes at 1000 rpm (approximately 200 x g) at 4°C. The cell-free culture supernatant is removed with a sterile polypropylene pipet and transferred to sterile polypropylene tubes. Samples
30 are maintained at -30 to -70°C until analysis. The samples are analyzed for

interferon (α) by ELISA and for tumor necrosis factor (α) by ELISA or IGEN Assay.

Interferon (α) and Tumor Necrosis Factor (α) Analysis by ELISA

5 Interferon (α) concentration is determined by ELISA using a Human Multi-Species kit from PBL Biomedical Laboratories, New Brunswick, NJ. Results are expressed in pg/mL.

Tumor necrosis factor (α) (TNF) concentration is determined using ELISA kits available from Biosource International, Camarillo, CA. Alternately, the TNF
10 concentration can be determined by ORIGEN M-Series Immunoassay and read on an IGEN M-8 analyzer from IGEN International, Gaithersburg, MD. The immunoassay uses a human TNF capture and detection antibody pair from Biosource International, Camarillo, CA. Results are expressed in pg/mL.

15 TNF- α INHIBITION IN MOUSE CELLS

Certain compounds of the invention have been found to modulate cytokine biosynthesis by inhibiting production of tumor necrosis factor α (TNF- α) when tested using the method described below. Particular examples include but are not limited to the compounds of Examples 14, 15, and 481.

20 The mouse macrophage cell line Raw 264.7 is used to assess the ability of compounds to inhibit tumor necrosis factor- α (TNF- α) production upon stimulation by lipopolysaccharide (LPS).

Single Concentration Assay:

25 Blood Cell Preparation for Culture

Raw cells (ATCC) are harvested by gentle scraping and then counted. The cell suspension is brought to 3×10^5 cells/mL in RPMI with 10 % fetal bovine serum (FBS). Cell suspension (100 μ L) is added to 96-well flat bottom sterile tissues culture plates (Becton Dickinson Labware, Lincoln Park, NJ). The final
30 concentration of cells is 3×10^4 cells/well. The plates are incubated for 3 hours.

Prior to the addition of test compound the medium is replaced with colorless RPMI medium with 3 % FBS.

Compound Preparation

5 The compounds are solubilized in dimethyl sulfoxide (DMSO). The DMSO concentration should not exceed a final concentration of 1% for addition to the culture wells. Compounds are tested at 5 μ M. LPS (Lipopolysaccharide from *Salmonella typhimurium*, Sigma-Aldrich) is diluted with colorless RPMI to the EC₇₀ concentration as measured by a dose response assay.

10

Incubation

A solution of test compound (1 μ L) is added to each well. The plates are mixed on a microtiter plate shaker for 1 minute and then placed in an incubator. Twenty minutes later the solution of LPS (1 μ L, EC₇₀ concentration ~ 10 ng/ml) is added and the plates are mixed for 1 minute on a shaker. The plates are incubated for 18 to 24 hours at 37 °C in a 5 % carbon dioxide atmosphere.

15

TNF- α Analysis

Following the incubation the supernatant is removed with a pipet. TNF- α concentration is determined by ELISA using a mouse TNF- α kit (from Biosource International, Camarillo, CA). Results are expressed in pg/mL. TNF- α expression upon LPS stimulation alone is considered a 100% response.

20

Dose Response Assay:

25 Blood Cell Preparation for Culture

Raw cells (ATCC) are harvested by gentle scraping and then counted. The cell suspension is brought to 4 x 10⁵ cells/mL in RPMI with 10 % FBS. Cell suspension (250 μ L) is added to 48-well flat bottom sterile tissues culture plates (Costar, Cambridge, MA). The final concentration of cells is 1 x 10⁵ cells/well. The

plates are incubated for 3 hours. Prior to the addition of test compound the medium is replaced with colorless RPMI medium with 3 % FBS.

Compound Preparation

5 The compounds are solubilized in dimethyl sulfoxide (DMSO). The DMSO concentration should not exceed a final concentration of 1% for addition to the culture wells. Compounds are tested at 0.03, 0.1, 0.3, 1, 3, 5 and 10 μ M. LPS (Lipopolysaccharide from *Salmonella typhimurium*, Sigma-Aldrich) is diluted with colorless RPMI to the EC₇₀ concentration as measured by dose response assay.

10

Incubation

A solution of test compound (200 μ L) is added to each well. The plates are mixed on a microtiter plate shaker for 1 minute and then placed in an incubator. Twenty minutes later the solution of LPS (200 μ L, EC₇₀ concentration ~ 10 ng/ml) is added and the plates are mixed for 1 minute on a shaker. The plates are incubated for 18 to 24 hours at 37 °C in a 5 % carbon dioxide atmosphere.

15

TNF- α Analysis

Following the incubation the supernatant is removed with a pipet. TNF- α concentration is determined by ELISA using a mouse TNF- α kit (from Biosource International, Camarillo, CA). Results are expressed in pg/mL. TNF- α expression upon LPS stimulation alone is considered a 100% response.

INTERNATIONAL SEARCH REPORT

International application No.
PCT/US 03/40373

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claims Nos.:
because they relate to subject matter not required to be searched by this Authority, namely:
2. ☒ Claims Nos.: 1-7
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
see FURTHER INFORMATION sheet PCT/ISA/210
3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.

FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

Continuation of Box I.2

Claims Nos.: 1-7

Present claims 1-7 relate to an extremely large number of possible compounds. Due to the expression "non-interfering substituents" the claims contain so many options that a lack of clarity (and conciseness) within the meaning of Article 6 PCT arises to such an extent as to render a meaningful search of the claims impossible. Consequently, the search has been carried out for those parts of the application which do appear to be clear (and concise), namely claims 8-136.

The applicant's attention is drawn to the fact that claims relating to inventions in respect of which no international search report has been established need not be the subject of an international preliminary examination (Rule 66.1(e) PCT). The applicant is advised that the EPO policy when acting as an International Preliminary Examining Authority is normally not to carry out a preliminary examination on matter which has not been searched. This is the case irrespective of whether or not the claims are amended following receipt of the search report or during any Chapter II procedure. If the application proceeds into the regional phase before the EPO, the applicant is reminded that a search may be carried out during examination before the EPO (see EPO Guideline C-VI, 8.5), should the problems which led to the Article 17(2) declaration be overcome.
